

RADAR KIT for OverGate4.0

No title

Description

The Radar Kit is an accessory intended for the opening command and for the control of the product OverGate 4.0.

This kit allows also regulating the depth of the radar field acting on a specific adjusting trimmer.

Radars are ideal when we do not want to use any customer guide rail systems such as for the photocell kit. When checking the possibility to use a radar kit for the opening of a passageway OverGate 4.0, it is important to consider the surrounding environment. A very intense pedestrian flow can make the gate open accidentally. Any eventual objects in front of the gate, such as exhibitors, may decrease the radar efficiency. Please contact us to receive further information.
